Abstract

It is evident that externalisation policies mirror stark power asymmetries of the global and regional political orders, and thus reflect social inequalities more generally. What is new about contemporary remote control across borders? An important element is the reference to human rights norms by various political actors such as NGOs, migrant associations but also some national governments, international organisations and an activist judiciary. The contestation around externalized migration control has gone through several periods. Integral to an understanding of control are the practices of migrants themselves, how they seek to circumvent controls and resist. Thinking further ahead, we may conceive of the border as a paradox, involving both connecting and separating humans and artefacts. Such an understanding of border allows for the possibility of coexistence; difference between two or more entities being a requirement. The border does not belong to either side. How to imagine such a type of border between states is a formidable challenge to social theory.

Keywords: Externalization, Border(s), Social and global inequalities, Migration control

Externalisation policies or, as they are sometimes called, forward control or remote control policies, are not entirely new. Visa policies, for example, were used by US authorities in granting access to the territory in the late 19th and early 20th centuries to prospective European emigrants on their way to the Americas.² So, what is new about contemporary remote control? An important element of today's externalisation efforts is the reference to human rights norms by various political actors such as NGOs, migrant associations but also some national governments, international organisations and an activist judiciary in international courts. In a nutshell, human rights have entered the realms of international mobility and border control increasingly since the late 1970s when it comes to evaluating social orders as legitimate or illegitimate.³ Struggles around human rights have been among the most contentious issues of externalisation policies and their consequences. Externalisation of control is part of a general trend which has made borders ubiquitous by extending the reach of control both spatially and institutionally, both within states and beyond. It is evident that externalisation policies mirror stark power asymmetries of the global and regional political orders, and thus reflect social inequalities more generally. Nonetheless, the crucial question is how the discontents have been voiced and have resulted in corresponding responses

to measures imposed by regional powers such as the EU upon its close and more distant neighbours.⁴

Three periods of the politics of human rights in externalisation

Following the past four decades, three periods in the politics of human rights in externalisation efforts can be distinguished, largely driven by an endogenous dynamic. The first period saw the emergence of the liberal paradox⁵, or what can be called the rule of law dilemma⁶, in the 1970s: the human rights of non-citizen migrants became more prominent in contradistinction to sovereign national state interests which until then had not taken into consideration basic rights of migrants – including irregular ones – to, for example, emergency health care. The second period was mainly characterised by the externalisation of migration and border policies on the part of actors such as the EU and its member states, which tried to offload the costs of control to countries of origin and transit. These externalisation policies have been meant to circumvent the rule of law dilemma by trying to prevent migrants from reaching the territories of immigration states in the first place. Restrictive visa policies, adoption of EU-compatible control policies in countries of origin and transit, detention camps for those migrants just outside the borders and deportation procedures aimed at those undesirables who made it into immigration states have been among the characteristic measures. Yet there has been a counter-movement, driven by NGOs and national, inter- and supra-national courts, which criticised these policies and ruled in favour of human rights norms to be applied everywhere, at least in principle.⁷ Finally, the third period, which has been slowly emerging, is one in which European countries are engaging more directly with the states in the *cordon sanitaire* around Europe and even farther afield in states labelled as denoting the global South. Yet these states are not simply passive recipients of externalisation measures. Instead, such states are engaging in a sort of migration and border diplomacy with the EU.⁸

Clearly, the three periods just sketched overlap, and are thus to be taken as a heuristic device to distinguish essential precedents, characteristics and consequences of externalisation policies. In a very general sense, one could say that, especially in the second and third periods, Foucault's relational power perspective is at work: "where there is power, there is resistance".⁹ This means that the dynamics of externalisation are driven by a web of power relations between the various political actors involved, encompassing above all governments, courts and activist NGOs. Also, migrants are crucial players in circumventing and sometimes resisting externalisation policies.

Period one: Human rights on the advance

The first period was not one of externalisation but rather of internalisation, namely the integration of human rights within applied law of liberal democratic national states. It was only in the latter part of the 1970s that immigration states in Europe started to pay more attention to fundamental (human) rights for non-citizens. One of the path-breaking decisions involved was the by-now famous "Indian case" in 1978 in Germany. In this case, the Federal Constitutional Court decided that a non-German citizen—an Indian national— had a right to a permanent residence permit, based on his previous employment history.¹⁰ This more straightforward consideration of human rights created a liberal dilemma. According to this dilemma, most liberal democracies have, on the one hand, undertaken obligations to honour human rights conventions, such as the Geneva Convention on Refugees, and to extend fundamental rights even to non-citizen populations on their territory. On the other hand, these democracies seek to restrict the large-scale entry of migrants and refugees because of—among other reasons—security concerns, contentious politics around welfare state resources and regulations, and issues that are labelled cultural conflicts centred on religion and ways of life. Once forced migrants reach the territories of liberal democracies, the likelihood of their staying is rather high, thanks to human rights norms, even in the case of non-recognition as asylum seekers.

Through a sort of forward or remote control as part of externalisation policies, migrants do not even reach the territory of the immigration countries and, therefore, the rule of law dilemma does not arise. An important specific reason can be found in the *non-refoulement* principle enshrined in the Geneva Convention on Refugees (Article 33), which states that asylum seekers cannot be returned to countries

where they face life-threatening circumstances. Not surprisingly, it is against this background that externalisation is an attractive policy choice for destination countries to separate desirable from undesirable migrants already in the regions of origin and transit.

Period two: The externalisation of control and its unintended consequences

Efforts to circumvent the rule of law dilemma thus ushered in the second period, that of externalisation proper. Here, three examples are sketched: visa policies, extra-territorial zones and push-back at sea. The first one—visa policies—has been largely effective but with unintended consequences.¹¹ The second and third options are crucial from another angle: they have been criticised and brought to court by NGOs.¹² As to the first option, the concept that visa policies could function to outsource migration control was not well established. In the early 1990s the EU began its efforts to control its outer borders by vetting potential migrants in their countries of origin through visa requirements and checks at points of embarkation. The visa system and the Schengen requirements produce precisely the illegal practices of accessing visas that they are presumably meant to forestall.¹³ At the very least, one might argue, the unintended consequences of externalisation and securitisation become visible: Militarised borders between but also within African countries create higher risks for migrants, who in turn have to invest more resources to overcome these obstacles. Part of the process is the professionalisation of smuggling networks—more profit could be made but the journeys also became more dangerous. A case in point is Agadez in Niger, one of the hubs of travel from South to North in Africa. The original smugglers were displaced by a new group of smugglers who nowadays take even more insecure roads through the Sahara to avoid border controls. In due course the Sahara has developed, as did the Mediterranean, into a ‘mass grave’ or a ‘cemetery’.¹⁴ In short, the control policies designed to reduce the dangers of illegal migration turned into drivers of the very process they are meant to combat.

Second, also as a response to the rule of law dilemma, state authorities started to establish extra-territorial zones at points of entry into such states. The whole point of these zones is that—according to

state authorities—human rights do not need to be observed. An example which gained some prominence was the extra-territorial zone at the Charles de Gaulle airport in Paris, run by the French border police for 10 years, starting in the 1980s. The authorities argued that human rights have to be observed only within the state's jurisdiction, which is congruent with the territory of the state. Oppositional NGOs, however, reported on the human rights violations, exerted public pressure on the respective authorities through mass media, and informed UN human rights observatories. But most important, NGOs brought the case to national and international courts. As a result, the national courts and the European Court on Human Rights (ECHR) concluded that the extra-territoriality claimed by the French authorities was simply a legal fiction. It ruled that there is no “legal no man’s land,” and that there is no extra-territorial space devoid of human rights for tourists, migrants and refugees.¹⁵ We may interpret this development as a move toward de-territorialising human rights, that is, human rights are not tightly bound to the territorial reach of states although it is often the latter who usually enforce or violate these very rights.

The third example of externalisation measure concerns the push-back of vessels loaded with migrants from North Africa across the Mediterranean. The contested issue was whether human rights should be secured in international open sea. To an increasing degree, the legal opinion that human rights also apply in open sea—outside national territorial jurisdiction—has been voiced by the ECHR and expert committees of the UN since the 1970s. And it is since then that NGOs have intervened on a regular basis into border control regulations, e.g. Frontex. As a matter of fact, in the 2000s, Italian authorities tried to close off the central Mediterranean route from Libya to Italy. Again, NGOs went to court to have it confirmed that human rights apply everywhere, including in the open sea. In a decision by ECHR¹⁶, which concerned Somali and Eritrean migrants travelling from Libya who had been intercepted at sea by the Italian authorities and sent back to Libya, ECHR ruled that the push-back was contrary to human rights norms and amounted to “collective expulsion”.¹⁷ In particular, the courts decided that state sovereignty is exerted when its servants exercise effective control. However, such decisions have not prevented the deaths of thousands of migrants and refugees in their efforts to cross the Mediterranean. A common element of the second and third options is that they depend on mobilising NGOs and a rather activist judiciary.

Period three: Externalisation as imposition of and resistance to norms of control

Far from being a thing of the past, the struggles around extra-territoriality and application of human rights standards and norms are ongoing. These very struggles, advanced by endogenous dynamics depending on mobilisation through social movements and NGOs and a liberal rule of law, may have set the stage for a third period, in which the states constituting—from a European perspective—a sort of *cordon sanitaire* have learned to adapt to externalisation policies and try to extract benefits for themselves. One indicator of this third period is, as all contributions to this special issue argue, that countries of origin and transit are not simply passive recipients of an overpowering EU imposing its norms upon them. There has been no straightforward imposition of EU conditionality on states in the *cordon sanitaire*, such as Morocco, Turkey or Moldova. These states are better described as being engaged in migration and border diplomacy; there is room for brokering. A clear example is the EU-Turkey Deal which corresponds to “an ENP-like accession partnership”.¹⁸ This means that this deal is functionally equivalent to the European Neighbourhood Policy (ENP) scheme. Through this agreement, the Turkish regime receives financial support, makes itself indispensable for EU border policy, and has been able to position itself in a self-conscious way vis-à-vis the EU, plausibly demanding visa liberalisation (so far unsuccessfully). Is there already a sort of “reverse conditionality,” that is, transit and origin states pushing their own agenda?¹⁹ What is certain is that the EU Commission has used various circles of externalisation: a first circle is constituted by countries with whom the EU concluded the ENP, such as Moldova. With these states, readmission agreements and other forms of control have been achieved. Nowadays, such agreements are sought with and have already partly concluded with Egypt, Lebanon, Tunisia and Mauritania. They are meant to play a role similar to Turkey and Morocco as ‘gatekeepers’ for the EU. A second circle, somewhat more distant geographically, is made up of those countries with whom Migration Partnerships were concluded about a decade ago: Senegal, Mali, Nigeria, Niger and Ethiopia. In these cases, bargaining over readmission and stopping unwanted migrants (from the point of view of the EU) have proven more contentious, and visa waivers for citizens of these countries to EU states are still far away. In the meantime, some of the countries such as Mali and Niger have ended cooperating with the EU in the context of new geostrategic realignments with Russia and China. Short of ending cooperation, an expression of the contestation is the fact that the Malian government has refused twice to sign readmission agreements, with France in 2009 and with the EU in 2016/17.²⁰

Externalisation and its impact on internalisation

All these developments point to the need to analyse various scales of institutions and practices. Integral to an understanding of control are the practices of migrants themselves, how they seek to circumvent controls or even resist.²¹ All of the articles provide rich descriptions of resistance from below to externalised migration control; and they consider multiple levels of analysis, not only inter-state but also intra-state, transnational and cross-national. For example, civil society organizations in Mali, such as Afrique-Europe-Interact (AEI) and the Malian Association for Deportees (AME), condemned the Malian government for using tragic events, such as the death of many migrants in the Mediterranean near the Libyan coast in 2015, to observe a Day of National Mourning. Civil society organizations criticised the government's failure in bringing about economic development, which—in their view—underlie the high propensity to migration.²² Another example is the agency exerted by black women who are often depicted as lacking the ability to resist, expressed as “migrant-women-victim with no agency”.²³ What can be clearly discerned, however, is the resistance of African women to hindered migration. The obstacles to overcome consist of not only formal border control but also control within the group of migrants. For example, there is male control among the migrants themselves through elders (e.g. “chairman”), who facilitate or block access at the border crossing points of Ceuta and Melilla. Black women use various methods of agency; for instance, pregnancy for women is a way to increase chances of rescue through the Spanish border police. The latter are more likely to save groups with women and children.

This last finding points to internal hierarchies in the category of mobile persons in at least two ways. First, migrants en route experience various forms of exclusion from onward journeys. For example, as just reported, gender-based exclusion and violence are operative in migrant camps in Morocco and throughout journeys. This finding suggests that a focus on mechanisms of mobility and immobility en route which are based on categorisations along heterogeneities such as gender, age and citizenship is of utmost relevance. The task is to unveil the exact social mechanisms which are at work during the mobility trajectories.²⁴ Second, as data on global income inequalities indicate, it is mainly persons in the upper brackets of in-

²⁴ Faist, T. (2019).

come in the world which has the material means to engage in long-distance travel.²⁵ To refer mainly to the smooth cross-border journeys of privileged strata, such as expatriates working in multinational companies v. (ir)regular migrants trying to make it on their own, mostly with the help of their families, is short-sighted. More attention needs to be paid to the strategies of those who are mobile across borders or even across continents in contrast to those who (have to) choose in situ adaptation in locales of origin and locales along their often stalled journeys.

Negotiations over externalisation and internationalisation

An open question is the nexus of outsourcing and insourcing of control policies in such cases: states that are not passive recipients of European or North American rules of control will also have room for manoeuvre in dealing with migrants. Analysts have connected externalisation and internationalisation policies and responses with respect to European and North American contexts by viewing them as mirror images. In other words, remote control far afield is, for example, accompanied by rigorous surveillance by way of deportation and detention policies.²⁶ When it comes to connecting externalisation and internationalisation in countries being depicted as origin or transit countries, research is much scarcer.

The development of control policy in origin and transit regions such as West Africa has been one-sided. International organisations, funded by governments mainly of Europe, such as the International Organisation for Migration (IOM) stress that country of origin states participate in the formulation of migration policies. However, such a view underrates the extent to which European governments and international organisations influence the development of migration control policies with respect to ECOWAS member states such as Senegal, The Gambia and Guinea. Research suggests that while it may not be the “missionary” impetus of old that is at work, it is a “professionalizing” mission that has taken hold in a neo-colonial relationship.²⁷ While this kind of policy development benefits European states, the positive effects on the countries of origin and transit are uncertain.

While power relations between the mentioned states in Africa on the one hand and European governments and international institutions such as IOM and UNHCR are quite asymmetrical, both sides draw benefits from

the current situation. For example, the reference to neo-colonialist relationships is not to dismiss the observation that some of Africa's and the Middle East's authoritarian-ruled states are becoming veritable "migration profiteers".²⁸

In sum, questions need to be asked about the practices of states waving migrants through their territories without much support in terms of security or basic social protection. While it is plausible to argue that migration control policies in the neighbourhood of Europe are primarily shaped by policies designed in the EU, political actors outside the EU—in countries of origin and transit migration to the EU in particular—decisively contribute through their actions to migrants' experience of cross-border mobility and to the states' continued neo-colonial relationships with respect to migration control.²⁹

Countries of transit in Central and South America are far from "powerless pawns"³⁰ in the hands of the hegemonic country in the region, the USA. Costa Rica has pursued a comparatively humane approach to transit, making sure, for instance, that migrants can rest before continuing their onward journey north. At the same time, the pressures upon Central American countries to engage in securitised migration control policies has been immense although Costa Rica is relatively independent of US funding. Nonetheless, there have been zones of relative tolerance for transit migrants in countries such as Costa Rica. Ultimately, this double logic of care and control is indicative of the conflicting goals and expectations of actors seeking to adhere to humanitarian standards.

Conclusion: the border as a paradox

At the very least, these considerations suggest that borders have become ubiquitous, that they do not just represent territorial border lines but have been moving spatially into zones of transit and origin, and institutionally by the EU and its member states in transposing neo-colonial style control policies upon transit and origin countries in exchange for financial aid. It is worth probing into the multiple meanings given to borders. Borders are characterised by a certain degree of density of social relations and by the attribution of

meaning. In this way, we may think of the cross-border spaces or borderlands as transnational social spaces.

Thinking further ahead, we may conceive of the border as a paradox, involving both connecting and separating humans and artefacts. According to George Simmel, human beings are quintessential “border figures” (*Grenzwesen*): A person is a “connecting being who has to constantly separate and cannot connect without separating”.³¹ In other words, first, borders connect what is separated: for example, transnational mobility may enable families to unite who lived previously on different sides of borders in different states. Second, borders separate what is connected: states (and in Africa, mostly colonial powers) superimposed border lines and often tightly control movements at, into and through their territories. In essence, the exclusion of non-citizens outside the territory of national states and the inclusion of citizens into an imagined national community are two sides of the same coin. In short, the border is a paradox, and contestations over borders have to take this paradox into consideration.

Borders between states and the concomitant border spaces and borderlands signal an unequal power relationship in a global social order characterised by manifold inequalities; the different value of citizenship, depending on the status of the country in the global hierarchy, is but one example. All of this is very different from an understanding of border which sees it as a hindrance that can indeed be overcome and traversed. In other words, traffic across the border is a requirement for its constitution. By implication, in this perspective a sharp delineation such as a wall is not really a border. An understanding of border which privileged the dialectics of simultaneous connectivity and separation actually existed in Europe until well into the 18th and 19th centuries, before the advent of nationalism. Border in this meaning is a demarcation line which allows two entities to live next to each other. To put it differently, a border allows for the possibility of coexistence; difference between the two entities being a requirement. The border does not belong to either side. Such a nowadays utopian concept of the border could be a way to recognize differences and heterogeneities of entities (which are also in flux), the condition being that the two (or more) sides are fairly equal with respect to their social status. How to imagine such a type of border between states is a formidable challenge to social theory.
